

# Rechargeable Sealed Lead-Acid Battery

## PS-695 TOY

**Power-Sonic** rechargeable batteries are lead-lead dioxide systems. The dilute sulphuric acid electrolyte is suspended and thus immobilized. Should the battery be accidentally overcharged producing hydrogen and oxygen, special one-way valves allow the gases to escape thus avoiding excessive pressure build-up. Otherwise, the battery is completely sealed and is, therefore, maintenance-free and leak proof.

PS-695, PS-695 TH, and PS-695 TS are air transport approved, and meet all current requirements set forth by the D.O.T., I.A.T.A., F.A.A., and C.A.B.

U.L. recognizes models PS-695, PS-695 TH, and PS-695 TS under file number MH 14328.

**Discharge Characteristics**

**Discharge Time vs. Discharge Current**

**CHARGING**

**Cycle Applications:** Limit initial current to 1900mA. Charge until battery voltage (under charge) reaches 7.20 to 7.35 volts at 68°F (20°C). Hold at 7.20 to 7.35 volts until current drops to approximately 95mA. Battery is fully charged under these conditions, and charger should either be disconnected or switched to "float" voltage. **"Float" or "Stand-By" Service:** Hold battery across constant voltage source of 6.75 to 6.90 volts continuously. When held at this voltage, the battery will seek its own current level and maintain itself in a fully charged condition.

**NOTE:** Due to the self-discharge characteristics of this type of battery, it is imperative that they be charged after 6-9 months of storage, otherwise permanent loss of capacity might occur as a result of sulfation.
